

How to Save Files into FieldView from Email

Summary: FieldView users can save email .zip file attachments that contain Shape Files or 20/20 field (.dat) files into the FieldView app directly. This is another way to get prescription files or shared field files from another FieldView account into FieldView without having to use the web.

Step #1: Save Email Attachment to FieldView

- Open email and Long Press on an attached .zip file that contains either Shape Files or 20/20 Field Files.
- Choose “Open in FieldView” from the options presented
- FieldView will open with a message “Importing Files”

Step #2: Use files in FieldView App

- Shape Files will import as a prescription. They will be transferred to the 20/20 automatically when connected, and can be assigned to a Field using the Fields button on FieldView homescreen
- Field Files will import and build maps on the iPad. Note* Use this to import Field Files from a different FieldView account.
